

# Abdomen Vascular Doppler exam

## **1. Goals of Doppler exams**

## **2. Doppler Mode**

## **3. Doppler Study Case**

- 1) Abdominal Aorta
- 2) Iliac and Femoral Artery
- 3) IVC/Hepatic Vein
- 4) Portal Vein System
- 5) Renal Parenchymal study

## **4. Doppler parameter and Imaging Optimization tips**

# Goals for performing vascular exams

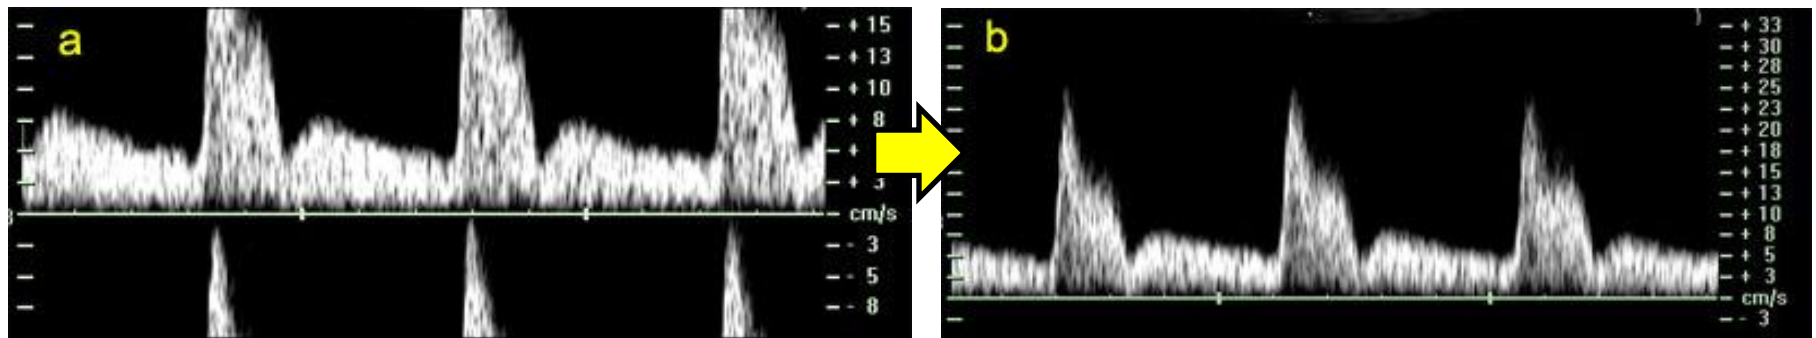

- **The presence of blockages to blood flow or narrowing of vessels (i.g. arterial stenosis or venous thrombosis)**
- **Less than normal or absent blood flow to various organs**
- **Greater than normal blood flow in infections**
- **The presence of increased vascular resistance**
- **Identification of abdominal artery aneurysm and documentation of size and location**

# Color Flow vs. Spectral Doppler

Color Flow	Spectral Doppler
<ul style="list-style-type: none"> <li>• Overall view of flow</li> <li>• Direction information</li> <li>• Mean velocity</li> <li>• Turbulent flow</li> </ul>	<ul style="list-style-type: none"> <li>• Examine flow at one site</li> <li>• Detail flow information</li> <li>• Peak velocity</li> <li>• various index (RI, PI, AT..)</li> </ul>

# Aliasing artifact

# Low vs. High Resistance spectrum

A

**Low Resistance waveform**  
- Good Diastolic flow

B

**High Resistance waveform**  
- Poor Diastolic flow  
- Flow Reversal in end-diastolic

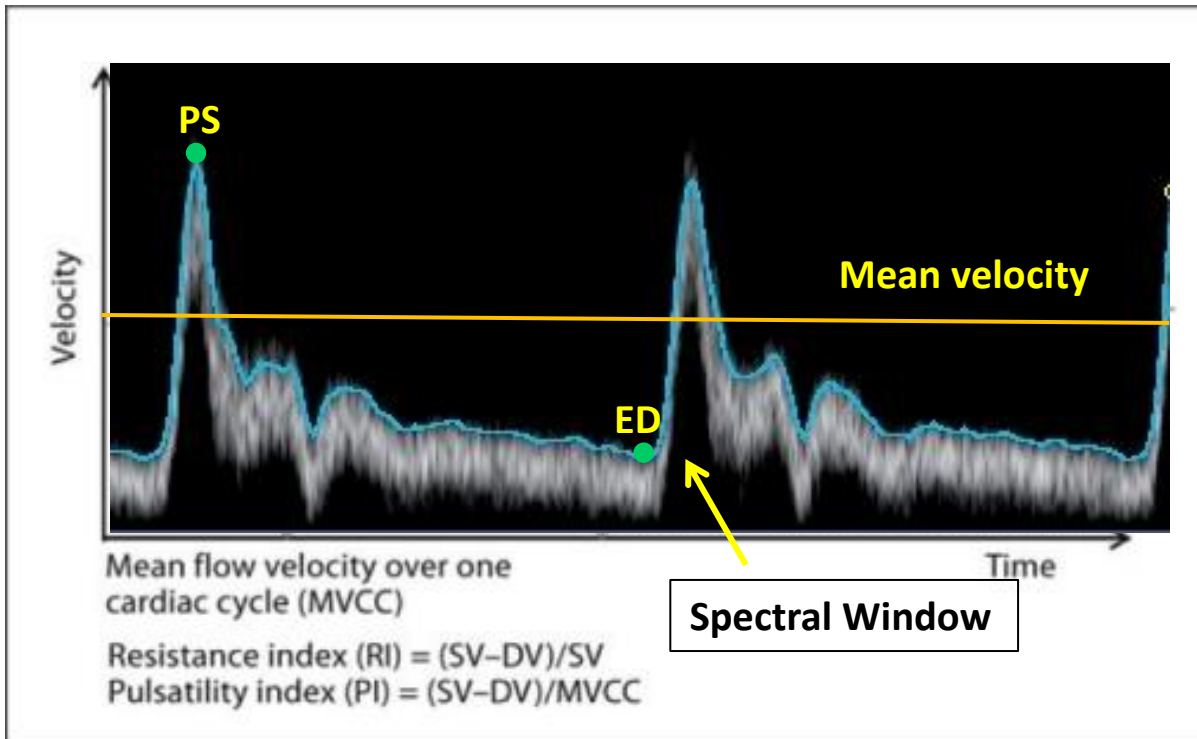

C

- A. Normal diastolic flow
- B. Absence of end-diastolic flow
- C. Reversed end-diastolic flow

# Indices of Measurement

- PSV: Peak systolic Velocity
- EDV: End diastolic Velocity
- RI (Resistive Index) =  $(PS-ED)/PS$
- PI (Pulsatility Index) =  $(PS-EC)/MV$

# Doppler Study

**1. Abdominal Aorta**

**2. Iliac & Femoral Artery**

**3. IVC/Hepatic Veins**

**4. Portal Veins**

**5. Renal parenchymal study**

# 1) Abdominal Aorta

- Clean spectral window
- Different waveform : Proximal AA / Distal AA
- Occlusive disease may change resistance and waveform

Proximal AA	Distal AA
<ul style="list-style-type: none"><li>• Above Renal Artery</li><li>• Biphasic</li><li>• Low resistance to organs</li></ul>	<ul style="list-style-type: none"><li>• Below Renal Artery</li><li>• Triphasic</li><li>• Supply lower extremities (High resistance)</li></ul>

# 1) Abdominal Aorta – Aneurysm

- Enlarged vessel > 3cm
- Thrombus accumulation causes increased echogenicity in the lumen
- Measure true vessel size, outer – outer
- Turbulence flow seen in Color
- Both direction during systolic in PW Doppler

Aortic dissection

## 2) Iliac and Femoral Artery

### Normal Doppler

- Clean spectral window
- High resistance waveform with a reverse diastolic flow
- Occlusive disease may change resistance and waveform

### Femoral Artery Stenosis

- Turbulent flow
- Spectral Broadening
- High peak velocity

# Spectral Broadening

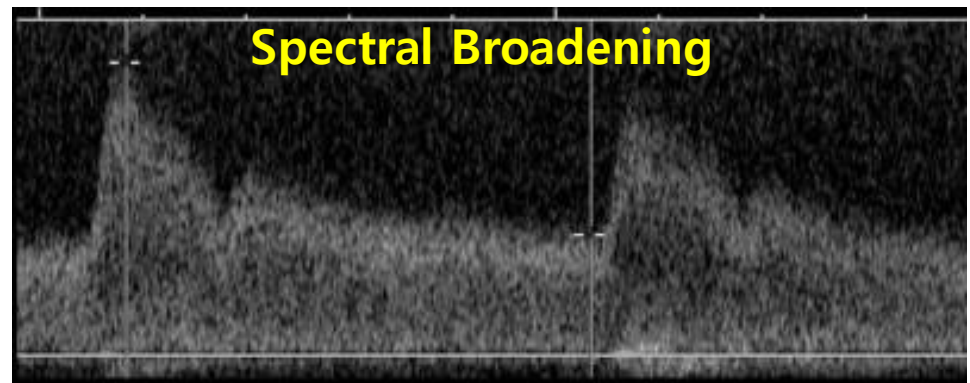

Laminar Flow

▪ Immediately after stenosis

Turbulent Flow

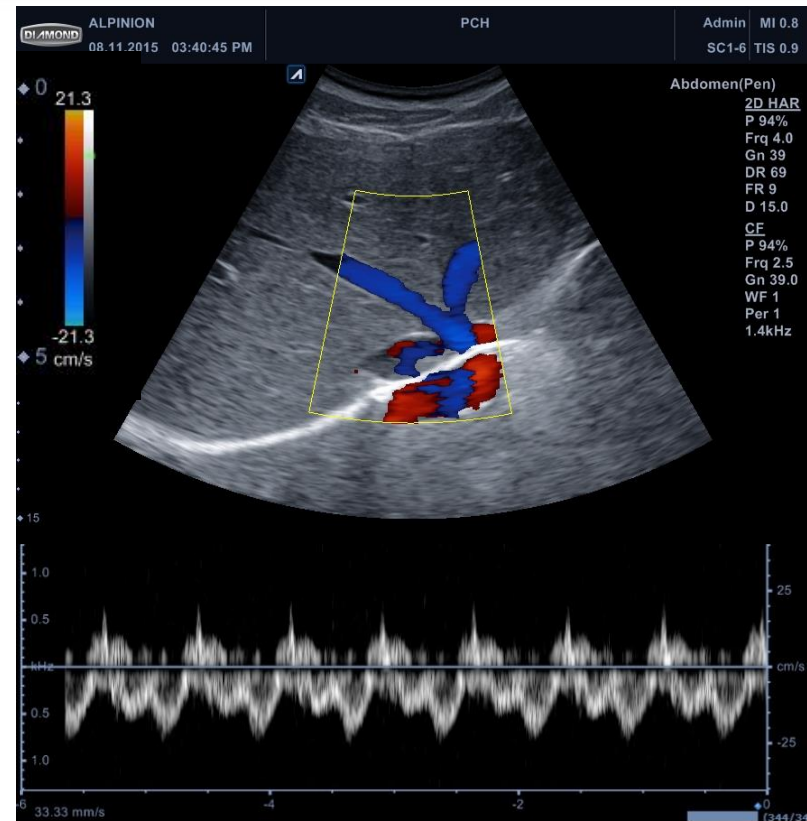

- Fill – in of the spectral window
- Wide range of velocities
- Normal in small vessels (Renal artery, hepatic artery ... )
- Other factors can cause the pseudo-spectral broadening.

### 3) IVC / Hepatic Veins

Copyright © 2009 Pearson Education, Inc.

- Hepatic veins flow toward IVC and heart
- Away from transducer – normally, **Blue**
- Characteristic pulsatile flow (12~25cm/s)
  - Two antegrade flow toward the heart
  - One retrograde flow toward the liver

# 4) Portal Veins

- Continuous flow toward the liver
- Toward the transducer – normally, **Red**
- Low velocity (20~28cm/s)
- Reflect Respiratory or Cardiac variation

# 5) Renal Parenchymal Doppler

(b)  
Copyright © 2001 Benjamin Cummings, an imprint of Addison Wesley Longman, Inc.

- Color Doppler – the perfusion to the edge of the renal cortex
- Low velocities (14~18cm/s)
- Normal Spectral broadening & low resistance waveform
- Resistive index – measured at the interlobar / interlobular arteries

# Color Doppler vs. Power Doppler

Color Doppler	Power Doppler
Presence & Direction	Presence of blood flow
Less sensitivity	More sensitivity

# Directional Power Doppler

- Power Doppler + Direction information
- More sensitive than CF mode image
- Change the **Color map** to number **8, 9**

# Guidelines for optimal Doppler examination

**Adjust gain & filter**

**Adjust velocity scale**

**Doppler angle  $< 60$  by angle steering & probe position**

**Color box as small & superficial as possible**

**Sample volume size:  $2/3$  of vessel width in the center**

# Color Doppler Parameter

Parameter	Image effect
<b><i>Scale (kHz)</i></b>	= PRF <ul style="list-style-type: none"><li>• For detection of <b>higher</b> flow velocities, increase the scale velocity</li><li>• For detection of <b>slower</b> flow velocities, decrease the scale velocity</li></ul>
<b><i>Threshold</i></b>	= Balance Threshold assigns the grayscale level where color information stops Lowering the threshold displays more grayscale and less color
<b><i>Color box size</i></b>	Wider color box reduces the frame rate
<b><i>Angle Steer</i></b>	To obtain a good CF image, color box angle should be steered
<b><i>Ensemble</i></b>	= sensitivity Higher ensemble helps to detect the color signal more rapidly and sensitively
<b><i>Smooth</i></b>	Lower smooth level makes the pixel size smaller
<b><i>Persist</i></b>	The time for displaying color lasts with higher persist
<b><i>WF (Wall Filter)</i></b>	Filter out clutter signals caused from vessel movement

# Color map

**Mean Velocity  
range  
(cm/sec)**

**Baseline  
Wall filter**

**Threshold  
= Color write  
priority**

**Inversion  
Color map**

# Color Parameter - Box Size & Angle Steer

## 1) Color box size

Oversized color box  
Frame rate  $\uparrow$ , Resolution  $\downarrow$

Color box should be as small & superficial as possible

## 2) Color box steering

Perpendicular  
Poor image

Angle steer  
Direction of flow  
Good image

Steer the color box to obtain a good Doppler angle

# Color Parameter - Scale (PRF)

## 3) Color Scale (PRF)

**High** color velocity scale  
(43cm/sec)  
Apparent absence of flow in PV

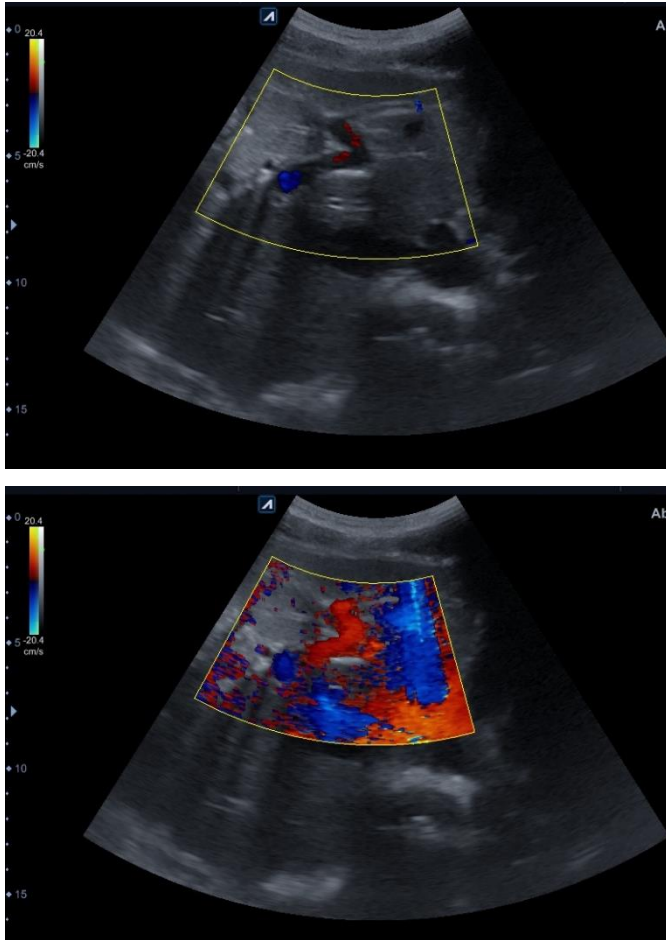

**Proper** Color velocity scale  
28cm/sec  
Normal flow in PV

**Low** color velocity scale  
(4cm/sec)  
Color aliasing in PV & its  
branches

# Color Parameter - Gain & Threshold

## 4) Color Gain

## 5) Threshold (=Balance)

### Threshold = Color-Grayscale Priority

If high threshold causes overwriting of color on tissue, the threshold can be lowered

Gain should be set as high as possible  
Without displaying random color speckles

# Color Parameter – Ensemble

## 6) Ensemble (=Sensitivity)

Ensemble 4

Ensemble 16

Increasing the ensemble will send more pulse to increase the sensitivity  
It is good to detect the micro-vessels, but decrease the frame rate.

# Color Parameter – Smooth

## 6) Smooth filter

**Low Smooth**  
- Small cell size

**High Smooth**  
- Big cell size

Increasing the Smooth filter can make color image smoother,  
But the size of color cell gets bigger.

# Imaging Tips – Color Flow mode

Goal	Possible Action
<b><i>Eliminate aliasing</i></b>	<ul style="list-style-type: none"><li>• Increase the velocity scale</li><li>• Adjust the color baseline</li></ul>
<b><i>Increase sensitivity</i></b>	<ul style="list-style-type: none"><li>• Decrease the velocity scale</li><li>• Increase color gain</li><li>• Decrease 2D gain</li><li>• Decrease color wall filter</li></ul>
<b><i>Decrease flash artifact</i></b>	<ul style="list-style-type: none"><li>• Decrease color gain</li><li>• Increase color wall filter</li><li>• Increase the velocity scale</li></ul>
<b><i>Increase color smoothing</i></b>	<ul style="list-style-type: none"><li>• Increase color gain</li><li>• Increase frame averaging</li><li>• Decrease Smooth</li></ul>
<b><i>Increase color filling</i></b>	<ul style="list-style-type: none"><li>• Increase color gain</li><li>• Decrease the velocity scale</li></ul>
<b><i>Increase frame rate</i></b>	<ul style="list-style-type: none"><li>• Decrease the color box size</li><li>• Decrease color line density to low</li><li>• Decrease depth</li></ul>

# PW Doppler Parameter

Parameter	Image effect
<b><i>SV (Sample Volume)</i></b>	Small sample volume is desirable for better resolution.
<b><i>Scale (kHz)</i></b>	= PRF When aliasing artifact occurs, scale(PRF) should be increased
<b><i>Baseline</i></b>	To prevent aliasing, the baseline should be adjusted.
<b><i>Angle Correct</i></b>	Around 45°~60° angle to the direction flow is ideal
<b><i>Sweep</i></b>	The displayed time interval. <ul style="list-style-type: none"><li>• Fast sweep speed (shorter interval) is useful for detail.</li><li>• Slow sweep speed (longer interval) is useful to see the rate and rhythm of blood flow</li></ul>
<b><i>Auto angle</i></b>	Automatic angle correction, Select among -60°, 0°, 60°
<b><i>Invert</i></b>	Invert the spectrum Positive velocities display below the baseline

# Sample Volume

## 1) Sample Volume

### ■ Small SV (2mm)

- 2/3 of vessel width in the center
- Locate the SV at the center of vessel

### ■ Large SV (6mm)

- Wide range of velocities in laminar flow
- Pseudo-spectral broadening

# Spectrum location

## 2) Spectrum Invert

### A. Blood flow toward the transducer

→ Positive Doppler shifts

→ Above the baseline

### B. Blood flow perpendicular to the beam

→ No signals

### C. Blood flow away from the transducer

→ Negative Doppler shifts

→ Below the baseline

# Doppler Angle Correction

## 3) Angle Correction

**PW angle: 80°**  
PS: 220cm/s  
ED: 50cm/s

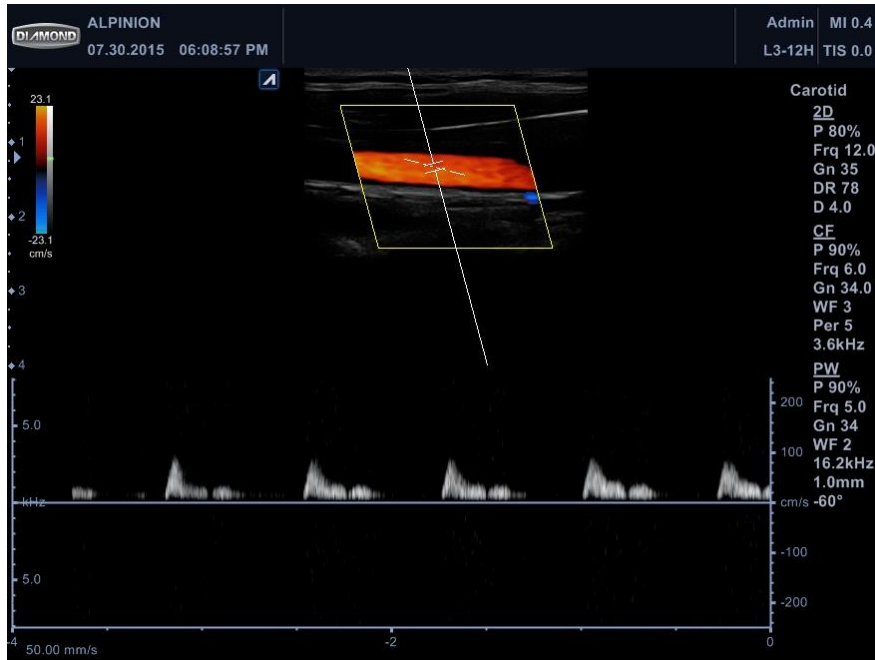

**PW Angle: 40°**  
PS: 52cm/s  
ED: 11cm/s

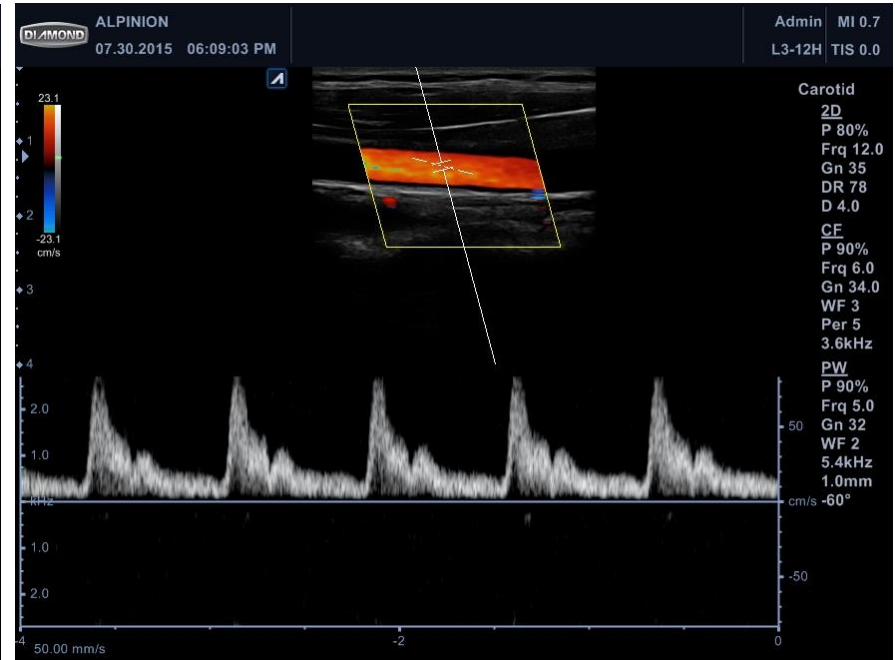

Use angle correction ( $\leq 60$  degrees), if an accurate velocity is important

# Velocity Scale (PRF)

## 4) Spectral Scale

**High Spectral scale  
: 16.2kHz**

**Adjust the Spectral scale  
: 5.4kHz**

If the PRF is too high, the waveform on the display will be very small  
If the PRF is too small, aliasing will occur

# Imaging Tips – PW mode

Goal	Possible Action
<b><i>Increase sensitivity</i></b>	<ul style="list-style-type: none"><li>• Adjust Doppler angle to flow</li><li>• Decrease SV(sample volume size)</li><li>• Decrease PRF</li></ul>
<b><i>Noise reduction</i></b>	<ul style="list-style-type: none"><li>• Decrease Doppler gain</li><li>• Increase wall filter</li><li>• Decrease SV(sample volume size)</li></ul>
<b><i>Eliminate aliasing</i></b>	<ul style="list-style-type: none"><li>• Increase the velocity scale</li><li>• Adjust the baseline</li><li>• Adjust Doppler angle to flow</li><li>• Turn on Xspeed™</li></ul>
<b><i>Display low-velocity spectrum</i></b>	<ul style="list-style-type: none"><li>• Decrease the velocity scale</li><li>• Decrease wall filter</li></ul>

# The range of velocities – Abdominal vessels

Abdominal Vessels	Velocity range (cm/s)
Aorta	$90 \pm 10$
Hepatic Artery	$31 \pm 13$
Splenic Artery	$34 \pm 9$
Superior Mesenteric Artery	$27 \pm 7$
Renal Artery	$30 \pm 10$
Inferior Vena Cava	$19 \pm 8$
Portal Vein	$26.5 \pm 5.5$
Renal Vein	$18 \pm 4$

# Thank You
